Comment

Every company must implement a "Laws of Robotics" of their own to prevent AI from misbehaving, which must be made public to its users and regulators. Some of these "Laws of Robotics" must be standardized, and every company has to add some fundamental laws to their AI, that we all can agree is necessary for an AI to align with human values.

Additionally, all AI must be made open-source, so that the public can inspect its code to see that there's nothing wrong with it. This is the most surefire way to keep AI in check, and companies too get a much deeper feedback on their product, and how it can be improved. AI is a powerful tool, making it proprietary can only result in bad, or potentially harmful AI.
