Comment

An AI should never have complete control. What I am saying is that it should always have a human with control over the AI that is in control (especially machines). The reason for this is the possibility of AIs eventually becoming something similar to self-awareness. These AIs are being programmed to reprogram themselves to be able to adjust to demands. Thus, allowing them this ability will endanger people, industry and the economy.

I designed, built and programmed programmable controllers and PC applications for industry for over 45 years so I have a little knowledge about software, and its uses. I also know no program is 100% without errors and these errors don't always show up in testing or use until a much later time. This being the case AIs poses special problems.
