Comment

I apologize for commenting anonymously, I am a pseudonymous independent artist and I usually keep my real life identity separate. I am aware this might impact the validity of my statements.

I want to speak purely on image based generative AI, as it's what I'm most familiar with, I believe these problems extend to all factors of machine learning that are growing in prevalence, however, as most of them function under the same machine learning rules: lots of data > patterns identified > those patterns interpolated together.

The current landscape for most generative image AI being pushed commercially was trained (see: copied) vast quantities of copyrighted and personal/private material (>5 billion images, all through LAION5B), and that trained machine learned tool was used as a basis for most of the visual training we're seeing today. Other algorithms developed such as MidJourney are almost definitely doing similar, even if not disclosed. As it is, the data that these algorithms
