Comment

Machine Learning models are poised to take over entire sectors of the creative field due to the opaque legality surrounding AI models training.

As it stands, AI can effectively plagiarize one's work, with no clear recourse for the victims to fight back against what is obviously theft of intellectual property.

I ask you to consider the following ideas:

- when prompted, make it obligatory for AI companies and users to be transparent with the datasets they used to train machine learning models

- training a machine learning model on one's data without that person's knowledge or consent should be considered an infringement of intellectual property

The largest AI models such as ChatGPT or StableDiffusion were trained on millions of pages of copyrighted text and pictures, to directly compete with the people it scraped data from, under the guise of being transformative. But it is obvious that machine learning interpolating data it was trained on is not analogous to human learning.
